

...as the gardener hung up the phone and sat down under the weeping willow, a deer stood in the yard devouring what was left of the rare flowers and shrubs, for the last time.

You see, the gardener had just called to order deer fence from Wayside Fence Co.!

You too can control deer damage!

The large deer population in the United States has become an increasingly difficult problem for many gardeners and property owners. Through the years, many home remedies have been rumored to alleviate the situation, all of which resulted in continuous deer problems. From spraying hot sauce on plants, to hanging ultrasound "deer deterrents," gardeners have tried everything!

At Wayside Fence Co. we offer a solution...Tenax Cintoflex deer control fence. Our product is made of polypropylene (plastic) giving it many benefits:

- economical (*less than a buck a foot!*)
- light-weight plastic
- easy to install by one person
- U.V. stabilized
- unaffected by extreme temperatures and severe weather conditions
- will not rust or discolor
- does not have sharp edges
- does not deform
- no special cutting tools are required
- maintenance free - no sanding, painting or finishing
- is virtually invisible, as it blends in with nature
- Cintoflex is recycleable, making it environmentally friendly
- it can be shipped via UPS

And it is proven to be effective! Protect your investment with Tenax Cintoflex deer fencing.

How does it work?

- 1 Keep deer from damaging specific gardens or landscaped areas on your property.
- 2 Keep deer from entering your property. Re-train deer so that they keep out!

What is Cintoflex?

Cintoflex was designed more than 15 years ago as an alternative to galvanized netting. It is manufactured from nontoxic, tough, flexible, high density black polyethylene with characteristics that withstand the effects of weather (extremes of hot and cold, ultra-violet rays) and contaminants, such as acids generated in the poultry farm. Cintoflex is produced by a patented stretching and extruding process. As a result, the mesh is manufactured as a continuous net, possessing strength normally associated with wire netting.

Cintoflex is easily handled and installed due to its extreme light weight. There are four different mesh sizes to choose from. Available in rolls up to 15 feet high, multiple overlaps are eliminated in installations where height is required, such as aviaries. The netting may be installed similar to any conventional fencing. Due to the material's light weight, support posts are not required as often. For added support, a bracing wire should be run along the top and bottom of the mesh. Cintoflex is ideal for a wide variety of applications including bird & deer control.

Tenax Cintoflex is reusable and versatile. It can be used for many applications:

as livestock and agriculture fencing for deer control around crops, gardens and perimeters, and as poultry fence for temporary pens, sick pens or runs

In mining, as a cover for cyanide ponds to protect birds

as sport and recreational fence

sporting area delineation such as tennis, golf and soccer courts

In landfills, to catch blowing debris without restricting air flow

utility fence, area restrictions, parking lots and property delineation

child's playground limitation

ball stop fencing

**Control Deer
NOW
to avoid damage
LATER!**

**With Premium, Plastic
Deer
Fencing**

Getting started is simple...

- 1** Determine the areas you wish to protect. Our product can be used to enclose your entire property, or selected areas (please note that the area should be **completely enclosed** for the best deer protection. In our experience, using the product along just one or two sides of the area could result in severe damage - it will allow the deer to enter from a particular direction, try to exit from another direction where the fencing has been installed, and damage your fence in their attempt to escape. Therefore, we recommend that you **completely enclose the area** you wish to protect, (enclose particular section(s) or your entire property).
- 2** Determine which product to order: If you choose to enclose your entire property, we suggest using our Premier weight Perimeter fencing called Premium P-Flex. If you choose to enclose small gardens or landscaped areas, our standard C-Flex product is recommended. Since deer do not like jumping into small areas, you may be able to use a lower height fence for narrow beds/small gardens. (Please see the Product Description section for complete information on both products).
- 3** Measure the area to be protected in order to determine how many feet of Cintoflex to order.
- 4** Determine what accessories you will need. Wayside Fence Co. offers a complete line of accessories to help you install your new deer fence. Please see our order form for a complete list of products and descriptions of their use.

A. The fencing can be attached to your existing trees with U - nails. When doing so, we recommend that the trees are no more than 20' apart. If so, our tubular 1 3/8" pipe rail steel, pressure treated 2" x 4"s or 4" x 4"s, or metal poles may be used and should be spaced no more than 15' apart.

B. Deer are notorious for trying to push under fence! In order to keep them from getting in, be sure the fence netting touches the ground so that you can anchor it using 12" to 18" metal stakes every 8' - 10', or by attaching a running length of wire end to end, securely fastening it to the bottom of the fence.

C. You will need to attach 12" long white ribbon onto the fence every 10' at a height of 4'. This will allow the deer to see the newly installed barrier, and keep them from running into it. The ribbon should be left up for six to eight weeks. It is **most** important to place ribbon along areas of high deer traffic and/or time worn paths (**we also recommend using a double layer of fencing where frequently traveled paths exist**).

- 5** Call us toll free to place your order at 1-800-847-7789. Your order will be shipped via UPS and will arrive complete with installation instructions.

Product Descriptions

All Cintoflex products are available in various heights. Each product, grid size and height is recommended for a particular use. The following information should help you make your product selection. If you need additional information, please call us.

Cintoflex C Line

The "C" line offers a 2" x 1 3/4" grid, which affords you non-visibility and high strength. Each height is suitable for a variety of applications:

4' is recommended for replacement of your standard welded wire product, where an informal and economical enclosure is desired.

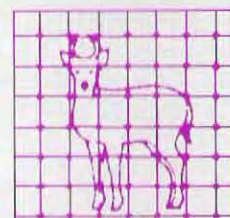

5' is good for protecting foundation plantings and flower beds from deer intrusion in low traffic areas.

6' is recommended for general purpose and for temporary fencing where a greater degree of safety is needed.

7.5' in the 100' and 330' lengths is our standard, economical perimeter deer fencing (Standard C-Flex). It is recommended as a perimeter enclosure for areas not experiencing high pressure deer situations.

7.5' x 164' is our premium, perimeter deer fencing (Premium P-Flex). It is a heavy duty product, designed exclusively for high pressure deer exclusion where deer habits and territories have previously been established. It is 65% stronger than standard perimeter fence, has square openings for equal flexing in all directions (making installation easier), is ideal for enclosing the perimeter of any property, is designed for low visibility after installation, and has a great survivability under heavy pressure.

10' and 15' Cintoflex are the same product as our standard deer fencing, but recommended for uneven terrains that might require extra height protection.

Control deer NOW!

Cintoflex D Line

This product offers a 1" x 1 1/2" grid, and is perfect for wrapping shrubs, and strong enough in its 15' height to be the perfect golf ball safety netting.

It can also be used as an excellent solution around tennis courts and at sports facilities where the fencing height is important.

Cintoflex E Line

This product offers a 1/2" x 3/4" grid. It is a slightly lighter weight than the "D" line, yet makes a highly effective shrub wrap.

Depending on the installation, this netting can protect against predatory birds, makes a high strength effective pond covering and is also good as sides and roof for aviary enclosures.

Cintoflex M Line

This product offers a 1" x 3/4" grid. It is used extensively in the poultry industry, as it is easily washed and withstands exposure to the acidic elements common in poultry farming. It is perfect flooring for chicken coops.

The "M" line is also excellent as protection on berry bushes, and is an excellent solution for around tennis courts and at sports facilities where fencing height is important.

It's slightly smaller grid makes this an excellent product for use as high strength pond coverings, aviary inclusion or exclusion, and for use on rafter barriers.

Tenax Cintoflex is being used for more and more applications every day! These are just a few suggestions for usage. If you need assistance in determining which product best suites your needs, do not hesitate to contact us at:
